

LumenCore Response to SAF-AQ-RFI-26-0001

Advanced Automation Contract RFI Capability Statement

Entity	Robert Ashworth / LumenCore
UEI	SQY2XW71ZM51
Primary NAICS	541511 - Custom Computer Programming Services
Response type	Small-business capability statement / market research response
Public proof gateway	https://lumen-core.ai/proof_to_pilot.html

Executive Summary

LumenCore is a pilot-stage AI infrastructure validation and orchestration company led by Robert Ashworth. The platform helps technical reviewers and mission owners decide which AI workflows are ready to pilot by converting model claims, tool outputs, source feeds, benchmark results, and operating assumptions into reproducible evidence packages.

For the Advanced Automation Contract environment, LumenCore is best positioned as an evaluation and proof-to-pilot layer: vendor/tool intake scoring, source provenance checks, baseline-vs-candidate replay where data is authorized, reviewer-facing proof cards, and human approval gates for high-impact automation paths.

Relevant Capabilities

- Vendor and tool intake scoring across AI workflow candidates.
- Source provenance checks, hash records, and evidence manifest packaging.
- Baseline-vs-candidate replay for automation workflows using approved input data, constraints, and metrics.
- Reviewer-facing proof cards that separate measured evidence from assumptions.
- Human approval gates before high-impact automation or external action.
- Negative-result preservation so failed or inconclusive tests remain visible to reviewers.

Recommended Evaluation Gates

- Source gate: register source owner, timestamp, hash, update cadence, and access boundary; mark data as measured, synthetic, simulated, or unverified.
- Baseline gate: define the incumbent process or non-AI baseline before scoring automation candidates.
- Candidate gate: run candidate workflows only against approved source and baseline bundles while recording configuration and failure modes.
- Review gate: present evidence cards showing improvement, regression, uncertainty, missing data, and operational caveats.
- Pilot gate: convert successful evaluations into limited-scope pilot plans with accepted metrics, reporting cadence, and rollback criteria.

Bounded Evidence Posture

LumenCore maintains a public proof-to-pilot reviewer surface at https://lumen-core.ai/proof_to_pilot.html.

Current artifacts include a 29-source inventory, 25 measured providers, hash-verified public proof feed deployment, and internal source-conditioned replay evidence across locked benchmark artifacts.

These artifacts are evidence of proof-stack discipline and internal replay capability. They are not being represented as field validation, realized savings, certified AI assurance, CMMC certification, ATO, or operational Air Force deployment proof.

Air Force Fit

LumenCore is strongest where the government needs a neutral evaluation layer across competing AI tools; a disciplined record of what was tested, against what data, and under which constraints; clear separation between demo claims and evidence-backed pilot readiness; and repeatable acceptance criteria that a technical review team can inspect.
