

LumenCore

Proof-to-pilot infrastructure for credible AI validation

**Built for reviewers
who need evidence
they can inspect, not
claims they have to
decode.**

Send-safe pitch deck
July 9, 2026

Current status: proof stack is reviewer-gated, human-controlled, and ready for a credibility sprint.

Reviewers cannot fund what they cannot verify

The bottleneck is credibility, not imagination.

Claims move faster than evidence

Advanced AI and R&D stories often arrive without source provenance, replayable results, or clear claim boundaries.

Review work is scattered

A technical reviewer has to chase data, baselines, metrics, risks, portal status, and IP boundaries across too many files.

Terms can move too early

Studios and investors may ask for equity before deliverables, cash burden, ownership, and validation milestones are written.

Luma's job is to make the next serious decision easier, faster, and safer.

LumenCore turns technical claims into decision-ready proof

The product is the evidence system around complex R&D.

Source validation

Live-source registry, current measurement status, refresh gaps, and public-safe source boundaries.

Replay receipts

Baseline-vs-candidate runs, holdout windows, metrics, failure slots, and SHA-256 receipts.

Reviewer packets

Decision brief, diligence Q&A, commercialization path, agency protocol, and data-room manifest.

Human gates

No sends, submissions, price commitments, equity acceptance, IP actions, or file sharing without approval.

The output is a cleaner yes, no, or next validation step.

The first product is a paid credibility sprint

A practical entry point before big dilution or broad promises.

Reviewer proof sprint

5-10 business days
Proof-card index, source register, decision brief, reviewer Q&A, and claim-boundary map.

Replay-scope package

10-20 business days
Baseline, metric, holdout window, data boundary, receipt schema, and dry-run report.

Field-validation pilot

Sector owner supplies real loss context. Luma locks the baseline and shows whether the replay can reduce the loss.

First money motion: paid proof or replay-scope sprint. Expansion: field validation pilots, agency submission support, and recurring proof portal access.

The proof stack is already measurable and gated

Current packet evidence is stronger than a concept deck.

Why this matters

The deck is backed by a data-room manifest, reviewer gate, commercialization packet, and venture-studio terms guardrail. It is not just narrative.

Boundary

These are proof-stack readiness metrics. They are not agency approval, investment, field validation, realized savings, or accepted terms.

Source: LumenCore funding sprint data-room manifest and measured-source register generated July 9, 2026.

The first customer is the technical decision-maker

The buyer is the person who must trust evidence before funding or piloting.

Agency or SBIR reviewer

Needs official-source fit, source-backed proof, and human authority gates before submission or routing.

Validation owner

Needs a repeatable receipt: data boundary, baseline, metric, holdout window, and replay path.

Venture builder or investor

Needs a clean business model, first paid offer, diligence room, and no unsupported claims.

Customer definition: serious reviewers who need inspectable proof before they spend money, issue invitations, or sponsor pilots.

Agent workspaces prove the market

Luma's wedge is validation, credibility, and proof-to-pilot packaging.

Genspark signal

General AI workspaces are training buyers to expect agents that create useful business outputs, not only chat responses.

Luma wedge

Luma focuses on proof-to-pilot work: evidence, replay receipts, source validation, reviewer packets, and funding readiness.

YC benchmark

YC is a dilution and credibility benchmark. Any studio asking 20% must justify value beyond cash, brand, network, and speed.

Funding path combines non-dilutive and venture routes

The near-term plan is traction, not a single all-or-nothing bet.

15

tracked opportunity
lanes

7

top-ready lanes

3

urgent lanes

Non-dilutive lanes

DARPA DICE, SBIR/STTR, NASA RFI, FHWA TSMO, and other official-source opportunities stay human-gated.

Venture lanes

EVTit, soft-tech venture studios, YC, angels, and strategic partners are evaluated against dilution, cash burden, and deliverables.

Decision rule: use the path that creates the most credibility per dollar and per point of dilution.

The money case comes from field validation

Luma needs sectors with real losses, not more abstract applause.

Locked internal baseline

The current proof stack can compare candidate behavior against named baselines and preserve replay receipts.

Real sector loss

The next customer supplies the operating context: wasted energy, delayed response, failed routing, downtime, audit cost, or missed throughput.

Economic proof

A pilot locks the metric and conversion factor so savings can be shown conservatively after field validation.

This is why grants and SBIR matter: they fund validation without forcing the company to oversell before the field data is in.

A studio deal must earn the dilution

The 20% discussion is worth exploring, not accepting verbally.

What must be written

Scope, deliverables, acceptance criteria, timeline, cash budget, IP ownership, vesting, termination, and conflicts.

What must be proven

The studio should increase credibility through product packaging, validation workflow, customer access, funding support, and diligence readiness.

Safer structures

Paid credibility sprint, milestone equity option, smaller equity plus success fee, or YC-parallel process before accepting major dilution.

Current posture: interested, not committed. Equity, cash, and IP terms require written review and counsel.

The ask is a 30-day credibility sprint

Make Luma easier to fund, review, and pilot.

Build

Send-safe pitch deck, reviewer portal front door, measured-source view, and proof-card navigation.

Validate

Replay-scope template, baseline/metric lock, pilot intake flow, and acceptance-standard checklist.

Package

Investor narrative, grant/SBIR packet refresh, terms guardrails, and partner diligence room.

Next step: agree on written sprint scope, deliverables, budget, and decision rights before any equity or terms commitment.
